

AI Portfolio and Delivery Suite

Product Overview | XLeratorAI | 2026

Eight integrated AI tools built around a central Data Orchestrator, covering everything from strategy generation and portfolio prioritization to dependency mapping, blueprint creation, and autonomous development. Each tool is capable on its own. Together they form a complete end-to-end operating system for enterprise AI delivery.

Delivery Framework: [Generally Available](#)

What the Suite Covers

The suite spans the full delivery lifecycle in four connected layers:

C-Level Strategy

The Strategy Generator researches your industry and produces an approved 18-month AI strategy. Multi-step human sign-off is required before anything moves downstream.

VP-Level Planning

The Portfolio Builder scores and ranks AI project candidates against your approved strategy, generates business cases, and exports directly to your project management platform.

PMO and Delivery

Portfolio Intelligence provides real-time PMO health with AI findings, cost variance detection, and blast radius analysis. DependencyIQ maps every project, system, and team dependency.

Build and Operations

Blueprint Generator transforms requirements into Epics and Stories. Developer Agent executes them autonomously. Portfolio Monitor observes every event. Learn and Optimize feeds results back to improve scoring over time.

Suite Architecture

The Data Orchestrator sits at the center of the suite. Every data movement, every ingest, and every export flows through it. The surrounding tools each handle a distinct function while remaining connected through this shared data layer. No tool connects to external systems independently.

The Nine Tools

Data Orchestrator The central data bus. Every ingest and export flows through a single point of control. Fires structured event signals to Portfolio Monitor and Learn and Optimize on every run.	Strategy Generator AI-guided wizard that researches your industry and produces an approved 18-month strategy. Automatically distributes the approved strategy downstream to Portfolio Builder on sign-off.
Portfolio Builder Scores and ranks AI project candidates against your approved strategy. Generates business cases and exports approved portfolios to Jira, Azure DevOps, Clarity, or CSV.	Portfolio Intelligence Real-time PMO health dashboard with AI-generated findings, cost variance detection, and blast radius analysis powered by DependencyIQ across all active projects.
DependencyIQ Graph engine mapping projects, systems, and teams as nodes with typed dependency edges. Enables blast radius analysis for any change or delay across the portfolio.	Blueprint Generator Conversational AI intake that transforms business requirements into structured blueprints, build specs, and Epics and Stories created in your project management platform automatically.
Developer Agent Polls your project management platform for assigned work and executes build tasks. Writes code, runs tests, and raises pull requests without manual handoff.	Portfolio Monitor Observability layer capturing every event across the suite. Real-time KPI tracking and configurable alert routing to email, Slack, Teams, or PagerDuty.
Learn and Optimize Collects outcome signals from every tool, adjusts scoring weights based on real results, and surfaces optimization insights back to Strategy Generator and Portfolio Builder.	

Human in the Loop at Every Step

Every tool in the suite is designed with human review as a first-class requirement. Strategy sign-off is required before distribution. Portfolio approval gates export. Blueprint review precedes development. The Developer Agent raises pull requests for human review before any code merges. Automation accelerates the work; people own the decisions.
